

Picacho

The reliability layer for AI-generated character content.

Investor overview — August 2026

THE PROBLEM

AI video generation is fast. It isn't dependable.

01

Identity drifts

The same character looks different shot to shot — wrong face, wrong outfit, wrong everything. Consistency is the whole point of a character, and raw generation tools don't hold it.

02

Credits burn on broken output

A failed generation still costs a credit. Creators re-roll manually, again and again, hoping the next attempt lands — with no visibility into why the last one didn't.

03

You are the QA department

Today's tools hand you a raw model and hope for the best. Nothing checks the output against the brief before it reaches you — that job falls on the creator, every single time.

THE SOLUTION

Picacho sits between you and the AI model.

We engineer the prompt, validate the result, and retry automatically — before a bad generation ever reaches you. It isn't another video generator. It's the reliability layer every other tool is missing.

THE PRODUCT

A workspace built around one character at a time.

Every generation shows its own pipeline trace and how many attempts it took to pass — reliability, made visible.

CONSISTENCY

One character, every angle, every time.

Reference photos anchor a character's identity across front, profile, and action shots. Add dialogue and Picacho generates lip-synced voice to match, powered by ElevenLabs and Sync Labs underneath.

Front

3/4 profile

Side profile

Action pose

Multi-angle generation

Voice + lip-sync dialogue

Unlimited character profiles

Projects, to organize by client or campaign

MARKET

Riding two markets that are both compounding.

\$3.7B

AI video generation & avatar tools, 2026

On pace for \$24.9B by 2036 as editing, avatars, and post-production converge into one category.

\$8.5B

User-generated content advertising, 2026

Growing ~29% a year — the exact budget line Picacho-made characters are built to fill.

U.S. creator marketing spend alone is on track for roughly \$44B this year. Every dollar of it depends on content that looks right the first time.

Sources: Fortune Business Insights, Grand View Research, Research and Markets — market-size reports, 2026.

COMPETITIVE LANDSCAPE

Speed is common. Reliability isn't.

Company	Est. ARR / revenue	Users / customers	Starting price	Positioning
HeyGen	~\$200M ARR	30M+ users, 196 countries	Free – \$149+/mo	Enterprise AI avatar video
Arcads	~\$15M ARR	6,000 paying teams	\$110/mo	AI actors for UGC ad creative
Captions (Mirage)	~\$28M/yr in-app*	3.2M downloads/yr	\$9.99/mo	Consumer creator video + AI Twin
Picacho	Pre-launch	—	\$19/mo	Reliability layer for AI characters

**Appfigures in-app revenue estimate, trailing 12 months to Mar 2026 – likely undercounts non-mobile revenue.
Sources: Latka, Sacra, Appfigures via TechCrunch, HeyGen and Mirage company reporting – all 2026.*

WHY WE WIN

Nobody else is building the reliability layer.

Validation, not hope

Every generation is checked against the brief before it reaches you, with automatic retries — not a one-shot gamble on raw model output.

Character-first, not clip-first

Built around a persistent character profile with reference photos, not a single throwaway prompt you re-type each time.

Reliability you can see

First-try success rate and attempt counts show up right in the product — the thing every competitor hides, we put on the screen.

BUSINESS MODEL

Simple, usage-based subscription pricing.

Plan	Price	Generations / mo	Notes
Starter	\$19/mo	10	
Growth	\$79/mo	40	Most popular
Studio	\$299/mo	150	+\$2.50 per extra generation
Elite	\$499/mo	300	+ storyboard & multi-reference

Straightforward monthly plans, no per-seat pricing, no annual lock-in required to start. Every plan includes the full draft → review → generate → validate pipeline and unlimited character profiles.

PROJECTED GROWTH — ILLUSTRATIVE

A conservative read on a comparable trajectory.

Paying customers

ARR run-rate

Modeled on a ~\$125/mo blended revenue per customer across our four plans, with a customer ramp paced behind Arcads' own documented path in this category (~\$1M ARR in year one, ~\$6M by month ~23, at similar pricing power). Illustrative only — not a forecast of certainty; actual results depend on execution and market conditions.

Let's build the reliability layer for AI content, together.
